

Computer Forensics and Electronic Discovery

LogicForce has in-house computer forensic specialists with training and experience in retrieving electronic data for legal matters. While maintaining strict chain-of-custody logs and employing sound forensic techniques, we have been able to extract "hidden" e-data for our clients, providing counsel with vital case-winning evidence that otherwise would have been missed.

Computer Forensic Services

As distinguished from "electronic data discovery", computer forensics is a science that involves the acquisition, retrieval, and interpretation of electronic data in a mathematically verifiable manner that does not compromise the integrity of the original medium. With LogicForce's computer forensic services, you can gain access to not only electronic files that are visible, but also to deleted files and other "hidden" areas of a hard drive where valuable evidence often resides.

E-Discovery Consulting

Take advantage of LogicForce consultants' experience working with a variety of law firms on a wide-range of cases involving e-discovery. We can assist you with developing a strategy for acquiring and processing electronic data, including drafting document requests, preservation letters, and interrogatories.

Electronic Data Discovery

For applications where a simple extraction of existing electronic files from a computer disk is needed, LogicForce can retrieve those e-files and load them into a litigation database where they can be reviewed by counsel. We can also subsequently create production sets, or assist you with creating your own production sets, from the e-file database.

Expert Witness

LogicForce consultants are uniquely qualified to provide expert witness testimony by a specialized formal training curriculum and significant case experience. Our consultants provide affidavits, expert reports, and direct testimony for case trials.
